INTRODUCTION

The aim to design and develop this project is to produce a web application for lot of irregularity, economic recession and unemployment faced by the society when they are passing through different times of lifetime. The lack of sufficient information about the useful opportunities creates difficulties to common people. They may miss important job vacancies needed while even they are economically weaker conditions. They manhood must be bothered about their congenital abilities and its opportunities atleast in their local areas.

This platform can be used for getting more accurate information about the need an vacancies in an area. This web application assistant for customers and workers for tracking and gain information about the needs.

Currently there is no proper online system for both workers and customers to meet their need. The communication between them are done by either physically meet or by connecting via the mobile phones. Some of the mobile applications which provide information about services in a local area also provide contact information of skilled labours in that area. But this information may not be well updated, and are not centralised. I introduce platform to aver come the various difficulties faced in the earlier system. Customers can easily find a verified worker needed for their job, and can request for a date and the worker accept the request .

ABSTRACT

Nowadays we are struggle to find workers for job such as coconut tree climbing, farming etc. The worker often missing their jobs because they do not know the person who giving the job, and in a normal situation people may only know few workers doing a particular job. They are not getting a chance to choose from, and the contact information of worker may be invalid.

Here, I introducing a platform were the worker and the person who need a worker are connected. A person can search for the worker from the categories of job that he is in needed, and can find suitable worker. The worker accept the request and get to the job.an admin will verify the workers profiles and ensure they are genuine.

Similarly, one of the problems that any person faces while moving from one house to another is the difficulty of carrying his old house old items to the new house. This problem is also helped to find a way through this platform that I present.
